
FIRST AI PILOT WORKFILE

Define one bounded use, protect the human decision and make a 14-day test observable before choosing a tool.

HOW TO USE THIS WORKFILE

- Complete it with the person who owns the result and someone who performs the work.
- Name one recurring responsibility - not a broad goal to use AI.
- Fill the fields digitally or print the document and write by hand.
- Do not enter confidential, regulated, client, patient or employee records.
- End with a keep, revise, stop or choose-a-different-problem decision.

01

Responsibility

Start with work that already exists. Separate the human decision from the smaller support task around it.

Work we are trying to improve

Name one recurring responsibility with a recognizable beginning and end.

Current friction

What repeats, slows down, gets missed or creates preventable rework?

Human decision

Which judgment, promise, relationship or approval still belongs to a person?

02

Boundaries

Decide what the system may support and what information or authority it must never receive.

AI-supported portion

Choose a small gathering, organizing, comparing, routing or drafting step.

Permitted inputs

List only the approved source information allowed in this pilot.

Prohibited inputs

Name private, regulated, sensitive, contract-restricted or unverified information that must stay out.

Source of truth

Which current policies, records, examples or approved answers should govern the result?

03

Review

Human review is a workflow only when a named person has the time, standard and authority to perform it.

Expected output

What should the system return, in what format and for whom?

Named reviewer

Who checks the result before anyone relies on it?

Quality standard

What must be accurate, supported, complete, on-voice and appropriate?

Escalation

When must the system stop, mark uncertainty or hand the work to a person?

04

Fourteen-day test

Compare the pilot with the current process. A useful test can be stopped and ends with a decision.

Baseline

How does the work happen now, and where does the friction appear?

Small measure

Compare time, repeated steps, missed contacts, preventable revisions or another observable condition.

Stopping condition

What failure, risk or additional supervision should immediately pause the test?

End decision

After 14 days: keep, revise, stop or investigate a different problem? Record the evidence behind the decision.

05

Reusable instruction

Turn the decisions above into a portable working brief. Keep it with your approved process documentation.

You are supporting [bounded task] for [person or team]. Use only [approved sources]. Do not use or infer [prohibited information]. Produce [specific output]. Mark uncertainty and missing information instead of guessing. Stop and request human review when [escalation condition]. The final decision and approval belong to [named role].

06

Decision record

The product is the decision, not the amount of material generated during the test.

Evidence from the test

What improved, what failed, what surprised you and how much review the new process required.

Keep, revise, stop or choose another problem

State the decision, the person responsible and the next review date.

Notes

Record any unresolved source, privacy, policy, training or implementation question.
